

Right:

A "rural parkway" style road section through one of the more heavily traveled streets in the district. Note absence of curbs. The street uses a profile, which is quite common in rural communities.

Below:

In certain locations in Maybeline, streets bridge streams. Bridges are required (rather than culverts) because they prevent damage to sensitive fish habitat. They could be old-fashioned one lane bridges (as shown) in order to slow traffic, reduce environmental impact, cut expense, and provide a pedestrian scale.

Above:
Simplified diagram of the overland storm-drain system. The storm-water is channelled overland in roadside swales (shown as blue dashed lines), to detention areas (shown as large blue dots). From there, the clean water is slowly released back into the nearby stream.
